Use-Case Flow Specification

Automated Rubric Assignment Evaluator

Use Case: UC-02 — Evaluate Student Project

Primary Actor: Student

Supporting Actors: Faculty Evaluator, Execution Sandbox

Preconditions

1. The student is authenticated.
2. The assignment is open for submissions.
3. A rubric and pre-configured unit-test suite are available.
4. The evaluation service and isolated execution sandbox are available.

Postconditions

5. The project is evaluated and an itemized rubric score with test results is stored.
6. The student can view the evaluation result when results are released.
7. The project is available for the peer-review assignment process.

Main Success Scenario

1. Student uploads the project ZIP file for the selected assignment.

2. System validates the archive structure, supported files, and integrity.

3. System places the valid submission in the evaluation queue.

4. System starts the configured unit-test suite in the isolated execution sandbox.

5. Execution Sandbox returns the test results.

6. System applies the configured rubric criteria and weights to the test results.

7. System generates and stores an itemized rubric score breakdown.

8. System displays a submission/evaluation status to the student and makes the result available according to release settings.

9. System passes the project to the peer-review assignment process.

Alternate Flow

3a. Invalid or corrupted submission: The system rejects the ZIP file, displays the validation error, and asks the student to upload a corrected submission. The use case returns to Step 1.
